## CONTENTS

*Introduction*  
“Significant points” in the study of complex systems  
Organization and Program  

## I  Transcripts

1  Can there be a science of complex systems?  
   1  General systems theory?  
   2  Some principles of complex system design  
      2.1  Homeostasis  
      2.2  Membranes  
      2.3  Specialization  
      2.4  Near-decomposability  
   3  Organizations and markets  
      3.1  The market bias of contemporary economic theory  
      3.2  Motivations in organizations  
      3.3  Adaptive production systems  
   4  Conclusion  

2  Evolution  
   1  Selection and production  
   2  Variation  

3  Psychology and corporations: A complex systems perspective  

4  Genome complexity (Session introduction: Emergence)  

5  Emergent properties and behavior of the atmosphere  

6  Systems properties of metabolic networks  

7  A hypothesis about hierarchies  

8  Session introduction: Informatics
## Papers

11 Theories in (inter)action: A complex dynamic system for theory evaluation in Science Studies

12 Modeling fractal patterns with Genetic Algorithm solutions to a variant of the inverse problem for Iterated Function Systems (IFS)

13 An artificial life model for investigating the evolution of modularity

14 From inductive inference to the fundamental equation of measurement

15 Controlling chaos in systems of coupled maps with long-range interactions 123
1 Introduction ...................................................... 124
2 Model and results .............................................. 124
3 Discussion ......................................................... 129

16 Assessing software organizations from a complex systems perspective 133
1 Introduction ........................................................ 134
2 The software process and its evaluation ....................... 134
   2.1 Different evaluations of the process ....................... 134
   2.2 Some facts: Feedback and emergent patterns .......... 135
   2.3 Design: Moving away from the technological paradigm .. 136
3 A metaphor for the software process: Morphogenesis ......... 136
   3.1 Emergence of software systems .......................... 137
   3.2 The human element as the substratum for the creation of processes ......................................... 138
4 Conclusion .......................................................... 139

17 Hazards, self-organization, and risk compensation: A view of life at the edge 143
1 Introduction ........................................................ 144
2 Self-organized criticality ......................................... 145
   2.1 Sandpiles ...................................................... 145
   2.2 Other self-organized systems ............................... 145
3 Risk compensation ................................................ 147
   3.1 Risk compensation theories ............................... 147
   3.2 Risk compensation, adaptation and power laws ....... 148
4 Hazards and the balancing act ................................ 148

1.1 Assessments of parameters needed to calculate BEP . . . 224
1.2 Conventional indicators of material standard of living and
socio-economic development. . . . . . . . . . . . . . . . . . . . . . 225
2 BEP as an indicator of development for socioeconomic systems . . . 226
3 Existence of an internal set of constraints on the evolutionary pattern
of socio-economic systems . . . . . . . . . . . . . . . . . . . . . . . . . 228
4 Establishing links across levels to check the feasibility of future scenarios229
5 The demographic transition as a shift between two metastable equilib-
rium points of the dynamic energy budget . . . . . . . . . . . . . . 232

24 Psychology and corporations: A complex systems perspective 239
1 Introduction . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 239
2 Organizations as currently organized . . . . . . . . . . . . . . . . 240
3 Using organizations to study complex systems . . . . . . . . . . . . 241
3.1 Cohesion and conformity in work group dynamics . . . . . . . . . . 241
4 Leadership as an emergent phenomenon . . . . . . . . . . . . . . . 243
5 Conclusion: The need for a sufficiently rich complex systems perspective245

25 Symmetry breaking and the origin of life 249
1 Thermodynamics and dissipative systems . . . . . . . . . . . . . . . 249
2 Statistical mechanics . . . . . . . . . . . . . . . . . . . . . . . . . . . 252
3 Cellular automata . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 253

26 Complexity and functionality: A search for the where, the
when, and the how 259
1 Complexity with an attitude – but which one? . . . . . . . . . . . . . . 259
2 Reductionism . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 260
3 In search for new laws . . . . . . . . . . . . . . . . . . . . . . . . . . . . 263
4 Where and when and how . . . . . . . . . . . . . . . . . . . . . . . . . . 264
5 From where to when . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 265
6 From where and when to how . . . . . . . . . . . . . . . . . . . . . . . . 266
7 Conclusion and outlook . . . . . . . . . . . . . . . . . . . . . . . . . . . 267

27 Biological design principles that guide self-organization, emer-
gence, and hierarchical assembly: From complexity to tenseg-
rity 269
1 Introduction . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 270
2 Complexity in living systems . . . . . . . . . . . . . . . . . . . . . . 271
3 Cellular tensegrity . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 271
4 Mechanochemical control of biochemistry and gene expression . . . . 275
5 The architecture of life . . . . . . . . . . . . . . . . . . . . . . . . . . . . 275
6 The evolution of form . . . . . . . . . . . . . . . . . . . . . . . . . . . . 277
7 Conclusion: Simplicity in complexity . . . . . . . . . . . . . . . . . . . . 278
# 28 Information transfer between solitary waves in the saturable Schrödinger equation

1. Introduction ............................................. 282
2. Information transfer .................................. 283

3.5 Rate equation analyses 419
3.6 Self-assembly with four part types 420
3.7 Encoding power of minus devices 421
4 A formal model 422
  4.1 Definition of self-assembling automata 423
  4.2 Construction of rule set 425
  4.3 Classes of self-assembling automata 427
  4.4 Minimum conformation SA 429
5 Summary 431

40 Aggregation and the emergence of social behavior in rat pups modeled by simple rules of individual behavior 433

1 Introduction 434
2 Basic strategy 435
  2.1 Experimental methods 435
  2.2 Basic model 437
3 Aggregation in autonomous individuals 441
4 The emergence of synchronized social behavior 443
  4.1 Evolutionary optimization 443
  4.2 Results 444
5 Mechanisms of aggregation 448
  5.1 Group thermotaxis 448
  5.2 Geotaxis 449
6 Conclusions 450

41 The role of information in simulated evolution 453

1 Introduction 453
2 The information hierarchy 455
3 The population level 455
  3.1 Information and robustness 458
4 The individual level 461
  4.1 The coding 461
  4.2 Information and the evaluation of structures 465
5 Discussion 470

42 Emergence of complex ecologies in ECHO 473

1 Motivation and context 473
2 The statistics 474
3 The ECHO model 475
4 Individual ECHO runs 479
5 Conclusion 483
### 43 Spatial correlations in the contact process: A step toward better ecological models 487
1 Introduction ......................................................... 487
2 Introduction to the contact process .................................. 489
3 Simulation details ...................................................... 489
4 Measures of heterogeneity ............................................. 489
5 Theoretical predictions ................................................ 492
6 Discussion .............................................................. 499
   6.1 Birthrate or density as independent variable? .................. 499
   6.2 Spatial correlations near extinction ............................ 499

### 44 Many to one mappings as a basis for life 503
1 Criteria for life ....................................................... 503
2 The principle of many to one mapping ............................... 504
3 Many to one mappings in the origins of life and evolution of complex networks .................................................. 504
4 Outlook ................................................................. 511

### 45 Generic mechanisms for hierarchies 513
1 Introduction ............................................................ 513
2 What is ‘discrete scale invariance’ ................................... 514
3 Properties ............................................................... 515
   3.1 Signature of DSI .................................................... 515
   3.2 Importance and usefulness of DSI ............................... 516
   3.3 Prediction .......................................................... 516
4 Mechanisms leading to DSI and examples ............................ 516

### 46 Emergence in earthquakes 519
1 Introduction ............................................................ 519
2 Role of water and phase transformations ............................. 520
3 Consequences and predictions ........................................ 521

### 47 Chemical oscillation in symbolic chemical system and its behavioral pattern 523
1 Introduction ............................................................ 523
2 Model ................................................................. 524
   2.1 Abstract rewriting system (ARS) ............................... 524
   2.2 ARMS .............................................................. 525
   2.3 How ARMS works ................................................ 526
   2.4 Brusselator on ARMS .............................................. 529
   2.5 On behavioral pattern of the system ............................ 532
3 Classification of behavioral pattern of ARMS ......................... 532
   3.1 Classification table of ARMS behavior .......................... 534
4 Condition of cycles emergence ....................................... 536
   4.1 Mathematical background ........................................ 536
5 Related work .......................................................... 537
48 Extinction dynamics in a large ecological system with random interspecies interactions 541
1 Introduction ..................................................... 542
2 Model ........................................................... 543
   2.1 Replicator equations with random interspecies interactions 543
   2.2 Introduction of the extinction threshold .................... 544
3 Results ........................................................ 545
   3.1 Basin-size distribution .................................... 545
   3.2 Extinction curves ......................................... 546
   3.3 Average fitness and the nature of the shrink matrix ... 548
4 Estimation of induction time .................................. 550
   4.1 Approximation 1 ........................................... 550
   4.2 Approximation 2 ........................................... 552
5 Discussion ...................................................... 553
49 Functional differentiation in developmental systems 557
1 Association and dissociation of system elements ............ 557
2 Compatibility model .......................................... 558
3 What parameters describe functions?—Life on the flow .... 562
4 Development of a system is a specialization of its elements 564
50 Tuning complexity on randomly occupied lattices 569
1 Introduction ..................................................... 569
2 Diversity and complexity ...................................... 570
3 Tuning effect and critical probabilities ....................... 571
4 Scaling relations ................................................ 573
5 Conclusion ........................................................ 576
51 Socioeconomic organization on directional resource landscapes 579
1 Introduction and motivation .................................. 580
2 Background and methodology ................................ 580
3 Spatially distributed agent model ............................. 582
   3.1 Production and consumption strategies ................. 585
   3.2 Dimensional analysis ..................................... 587
4 Results and discussion ......................................... 589
52 “Continuous time” in Feigenbaum’s model 597
1 Introduction ..................................................... 597
2 Expressions with continuous parameter ....................... 598
3 The functions $\mathcal{F}_\lambda$ for $\lambda = 2, 4$ ............ 600
4 An application to fractals: Mandelbrot set .................. 601
5 Conclusion and possible applications ....................... 601
53 Ordering chaos in a neural network with linear feedback 603
1 Introduction .......................................................... 604
2 System and analysis ............................................... 604
3 Summary and conclusions ....................................... 608

54 Self-organisation and information-carrying capacity of collectively autocatalytic sets of polymers: Ligation systems 613
1 Introduction .......................................................... 614
2 Dynamics of autocatalysis ....................................... 614
3 Ligation/cleavage systems ....................................... 616
   3.1 Binary systems ................................................. 617
   3.2 Functional decomposition ................................... 619
4 Conclusion .......................................................... 621

55 Self-dissimilarity: An empirically observable complexity measure 625
1 Introduction .......................................................... 626
2 Self-dissimilarity .................................................... 628
   2.1 Why might complex systems be self-dissimilar? ....... 628
   2.2 Advantages of the approach ................................. 630
3 Probabilistic measures of self-dissimilarity ................... 632
   3.1 Defining the structure at a scale ......................... 632
   3.2 Comparison to traditional methods of scaling .......... 635
   3.3 Converting structures on different scales to the same scale .. 637
   3.4 Comparing structures on the same scale ................ 638
4 Discussion .......................................................... 639
   4.1 Comparing structures when information is limited .... 639
   4.2 Features of the measure .................................... 640

56 Complexity and order in chemical and biological systems 645
1 Introduction .......................................................... 645
2 Order ................................................................. 646
3 Structural complexity of point systems ....................... 648
4 The simple molecules: ........................................... 648
5 Wing patterns of the butterfly Bicyclus anynana ........... 651
